

## 1. Your User Signs Into ATP

All user access to ATP is controlled by your organisation via your own private administration dashboard.

You can assign users to the mobile app individually or as groups.

When using shared group devices with one shared user login, individual user IDs can be captured using a barcode or RFID tag via a user ID badge and easily scanned into ATP.

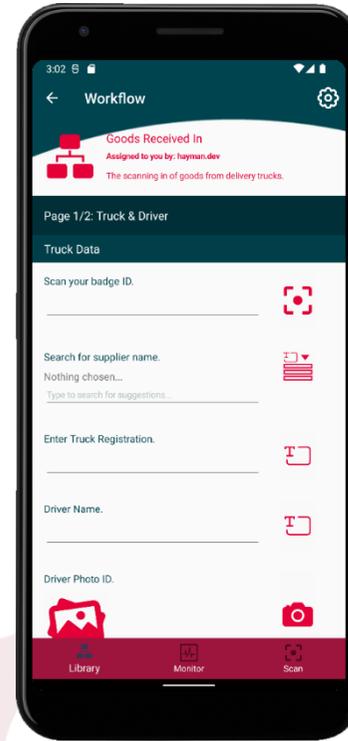

## 2. Choose Required Template

Once logged in, the user will be presented with one or more workflows.

Each workflow represents a different task or process flow your user needs to follow to complete a job.

Users can be assigned to different workflows to perform different tasks and processes.

Workflow tasks and process are created by our Workflow Builder software and customised to your requirements.

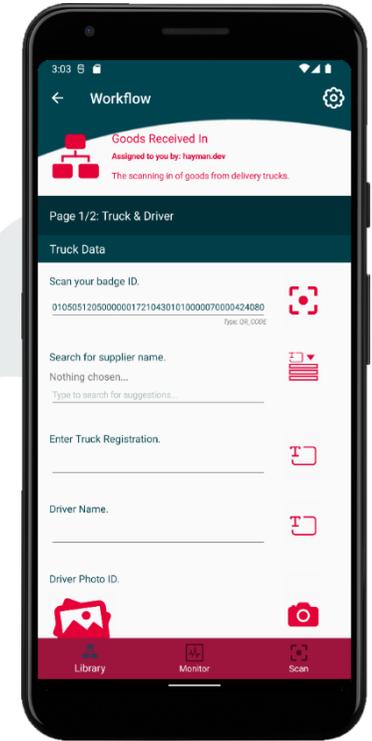

## 3. Lorry Arrives with Goods

Each day, our client's franchisee receives goods from various suppliers.

These goods need to be inspected, identified and stored into the correct storage boxes for safe keeping in ambient, chilled, or frozen storerooms.

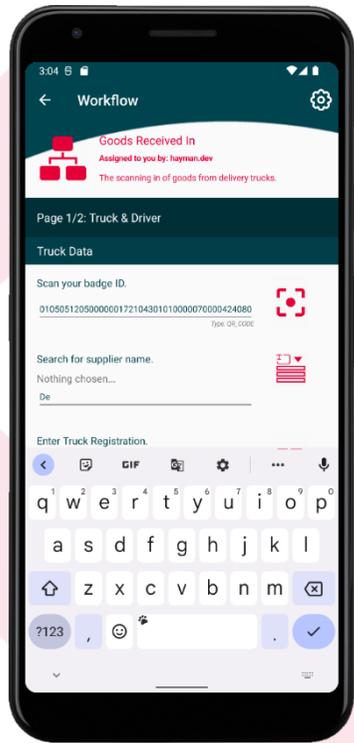

ATP helps by recording the process from delivery through to storage, but first identifying the operator receiving the goods, and the supplier delivering them.

## 4. Starting a Session

An operator wears a badge which identifies who they are. During a delivery they may be scanning multiple assets before the task is complete.

This initial starting page sets the stage for the following pages, capturing the common delivery data from the outset to allow multiple assets to be associated to this session.

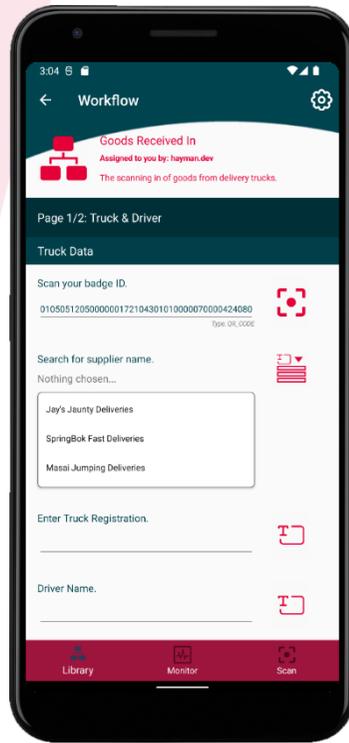

### 5. Data within Data...

ATP has many ways to record data quickly and efficiently, but more important, with regular accuracy.

In this example, this Workflow has a built-in database of known delivery companies that deliver to this franchise.

By typing just a few letters of the delivery suppliers name...

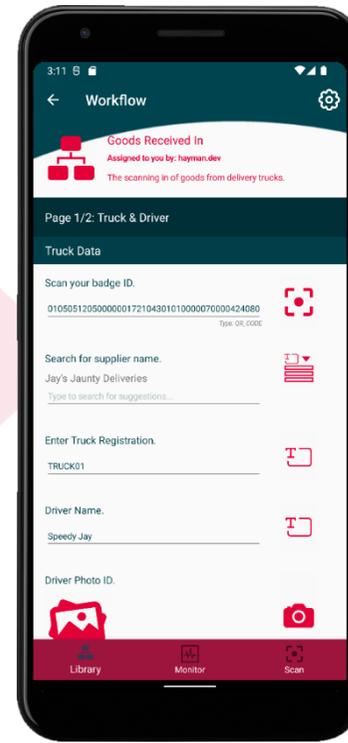

### 6. ...Creates Accuracy

...a list of matched suppliers is shown. By tapping a name, a choice is made by the operator. This reduces duplicated data caused by miss types and spelling errors.

More importantly, this data can be updated by the Workflow administrator, editing these options as and when they need to and publishing the changes to all devices assigned this Workflow, the ATP devices automatically updating.

Better still, you don't need to be online to match names via the search either.

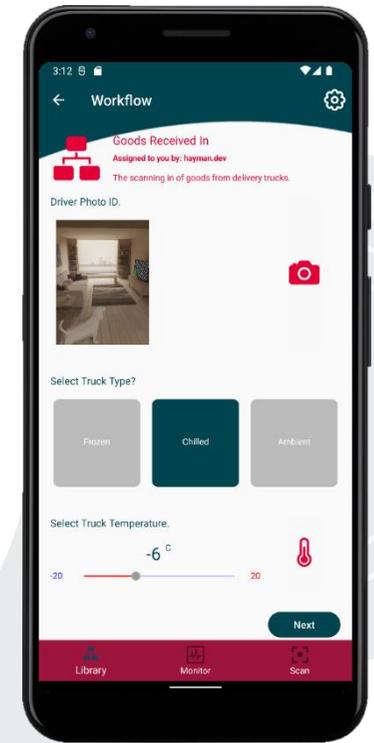

### 7. Delivery Ownership

A requirement from our client requested all deliveries to be "owned" by the company supplying them with the goods they need.

As a record of the delivery, the vehicles number plate and driver details are recorded.

This data can also be shared with the delivery company if the need arises to do so, a report can be produced.

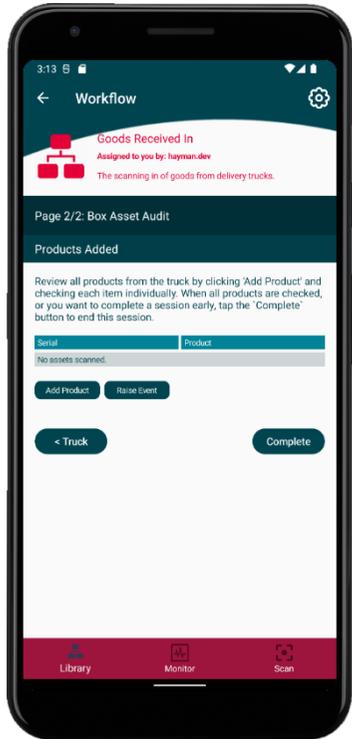

### 8. Checking Before Accepting

By choosing a temperature type, the operator can record the vehicles inner temperature value and record it in the App.

There are built-in limits within the Workflow to warn the operator if the temperature is out of acceptable range.

Should a temperature fail, this event is recorded, and a notification sent back to the franchise managers. The operator has no obligation to accept these goods.

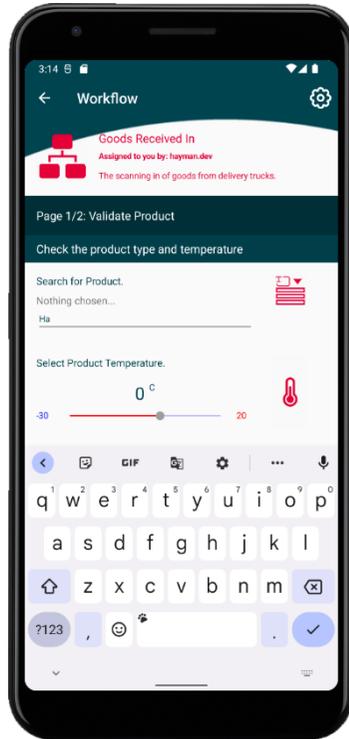

### 9. Multiple Assets in a Session

Each delivery typically consists of many assets for processing from the delivery company before being accepted into storage.

This table currently indicates that no assets have been added, but as the operator inspects and scans in goods, this table will grow until all the assets are added (either accepted or rejected).

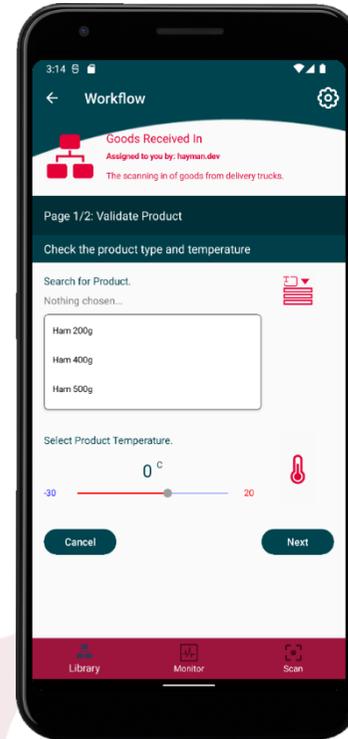

Tapping “complete” ends the session.

### 10. Data within Data...

At this step, this Workflow has another built-in database of known food types allowed from this delivery company and used by this franchise in particular.

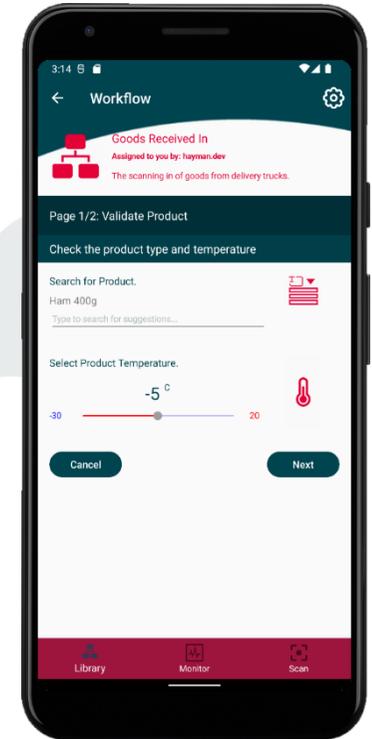

By typing just a few letters of the food suppliers name or type...

### 11. ...Creates Accuracy

...a list of known results is shown, and once again the operator and tap an option.

Accuracy is key to ensuring good auditing, and ATP can help improve this at even level of the data capturing process but using solutions like these, or ones we can develop just for you.

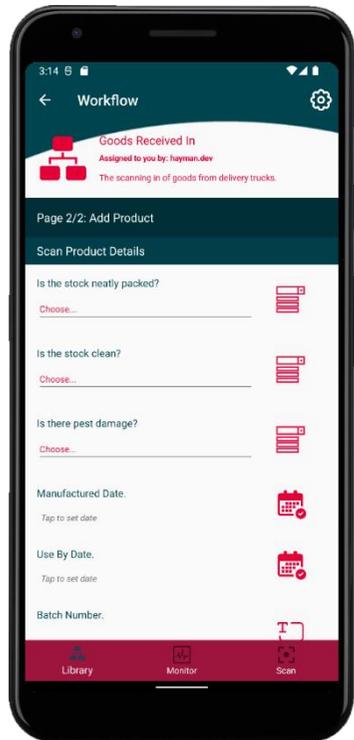

### 12. Checks within Checks

As each delivery vehicle is set to a particular temperature: Ambient, Chilled, or Frozen, so should the goods stored within.

If any of the goods tested with the temperature probe are outside of the agreed range for the temperature type, they are rejected.

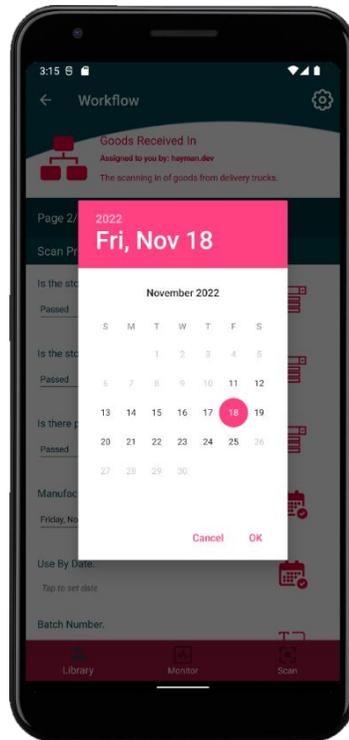

These rejected assets are also reported alongside any which did pass.

### 13. Ensuring Quality

Spoiled goods are bad for the customer as well as the client, so all goods are checked before being accepted.

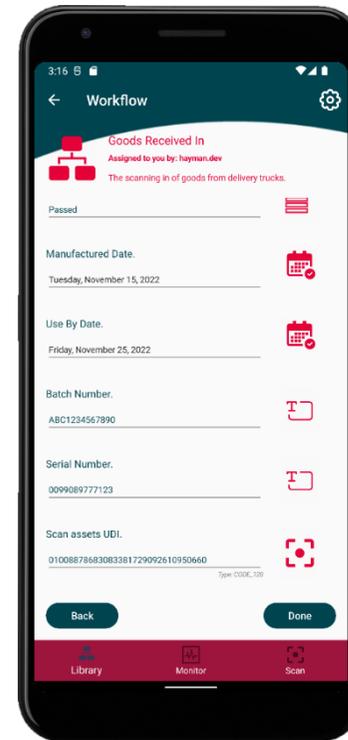

Each box is visually inspected and if any assets are seen to have damage, they are rejected, or possibly accepted if the operator deems the issue is not beyond acceptable limits.

### 14. Keep Things Fresh

The dates of the goods are recorded and assigned against each asset. This ensures items are stored for no longer than they should be, based on their use-by date and storage temperature type.

There are given limits built within the ATP Workflow for this client, which states how long a “frozen” item can be stored beyond its use-by date. This data is used again in another ATP Workflow dedicated to managing the use of stored assets in their storerooms.

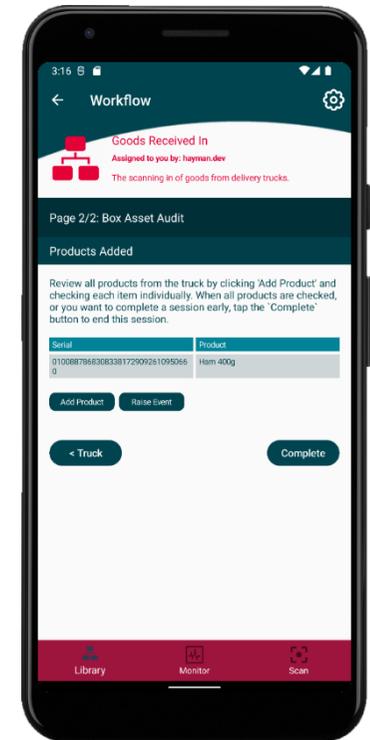

### 15. Auditing Supplier Data

Every box of goods has more asset data to store for future reporting and analysis.

ATP captures the serial numbers, UDI, and batch codes.

This is particularly useful for any recalled items that may happen in the future. At any time, our client can run a report to show how many assets are in storage that were recalled or had already been used.

### 16. Completing the Session

With the first box of goods recorded, the operator now repeats the process for all remaining assets.

The table will outline all the accepted and rejected items.

Once all assets are processed, tapping the complete button finalising the process and ATP automatically synchronises the data with the cloud, ready for managers to run their daily reports.
